shadow Strike OS architecture, as the README states it

Scaffold status, plainly: the design, manifest, dotfiles and provisioning scaffold v1 are in this repo.
The full rig is not built and this is not a downloadable distribution. NightSalvo is named as the flagship workload, not shipped here

layers checked, GK

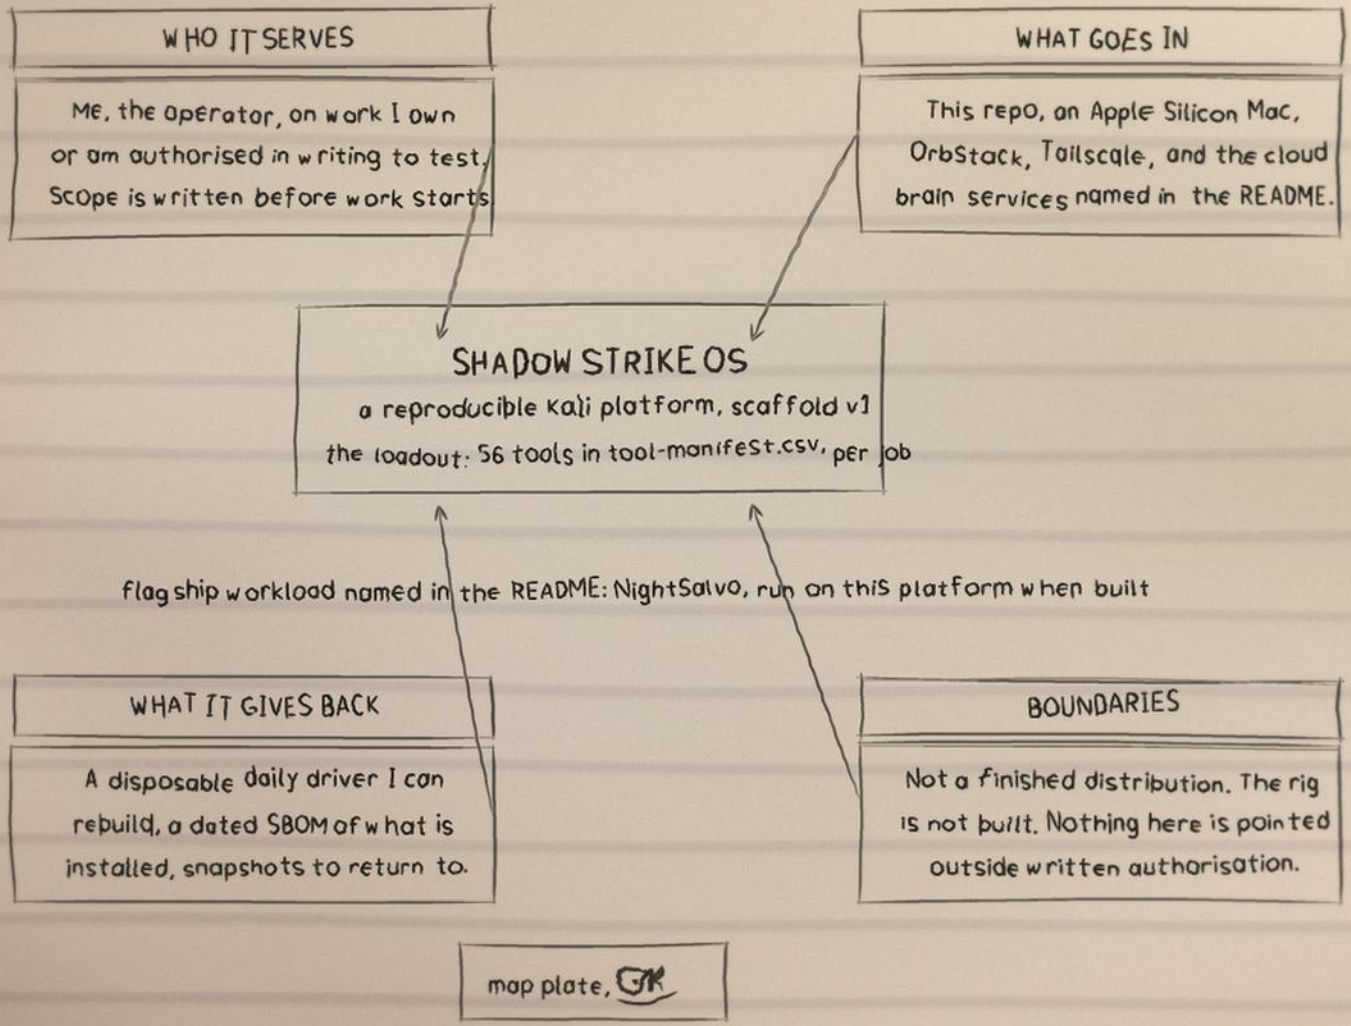

Building the platform: the README order

1. **Snapshot first**
   SNAPSHOTS.md: orb list, orb info, then clone or export if verified, else orb pull
2. **Create the machine**
   orb create kali shadow strike, then orb -m shadow strike
3. **Copy this repo in**
   orb push from the host, or clone it inside the machine
4. **Dry run**
   ./provision.sh --dry-run prints every action, every sudo, changes nothing
5. **Provision**
   ./provision.sh: apt rows, dotfiles with backups, MOTD, weekly SBOM timer, parity audit
6. **Manual rows by hand**
   BloodHound CE, Caido, Sliver and the other manual manifest rows
7. **Generate the SBOM**
   ./sbom.sh writes the dated inventory under sbom/
8. **Snapshot again**
   a provisioned, inventoried machine is the restore point

provision.sh is idempotent: a re-run converges the machine to the manifest.
Nothing past step 4 has been run by me on the real rig: the build itself is still ahead.

stairs drawn

Product map: a platform I rebuild from this repo

Components. the files this repo actually holds

provision.sh (221 lines)	tool-manifest.csv (56 tools)
The scaffold. Directory layout, the apt rows of the manifest, dotfiles deployed with timestamped backups, the wallpaper note, a weekly SBOM timer, then the parity audit.	The loadout: 27 apt rows, 12 go, 9 pipx, 7 manual, 1 github-release. Categories: web 10, terminal 9, recon 9, AD 8, cloud 5, credentials 5, reporting 4, frameworks 3, post 3.

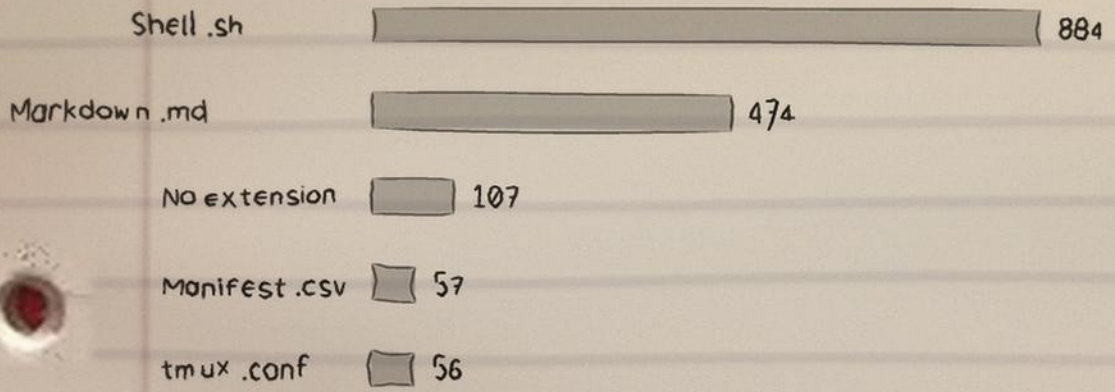

sbom.sh (65 lines)	kernel-parity/	dotfiles/ + docs
Dated inventory: dpkg list, pipx list, the manifest copy, a SUMMARY.txt under sbom/.	audit.sh (347 lines, read-only) checks the shared kernel. build-rtl88xxau.sh (251 lines) is the experimental driver route.	.zshrc, tmux.conf, fastfetch config, MOTD. SNAPSHOTS.md sets the backup discipline. assets/ holds the mark.

No kernel, no installer image, no built machine lives in this tree. Those are outcomes the scaffold aims at.

ShadowStrike OS in numbers, counted 2026-10-30

Lines by file extension over tracked files, images excluded. Full method in VISUAL.md.

21 tracked files, 5 commits, all of them dated 2026-10-30 in git log: this repo landed in one day.
Tests: no test suite exists. I syntax-checked the shell scripts with bash -n, and a --dry-run of provision.sh printed its actions.
The manifest itself is a number: 56 curated tools across 9 categories.

Shadow Strike OS: schematic of the apparatus

the system as a machine: parts, flow, and measurements
